

GENG5512 Digital Poster (10%)

An important part of research and development is being able to communicate your aims and your findings to a non-technical audience, or to those whose technical area is different to your own. This allows you to convey the importance of your work and its impact. For on-going research and development work in the future, it is an important aspect of obtaining funding for your work.

The digital poster should communicate the *aims*, *methodology* and *outcomes* of your work, and its *relevance* to society, in a form suitable for a lay audience. For the purposes of this deliverable you may assume that the audience has a general engineering or science background, but in a specialization or field different to your own. It is therefore important to convey what the problem is that you are working on, and why this work is important.

In order to attract interest (and funding) to your work, the poster needs to be engaging – it should be visually, rather than textually, oriented. It should avoid unnecessary detail. Your prospective audience may pass by the poster quickly – it should attract attention and convey the ‘story’ of your work quickly. It also needs to inspire confidence, and so should be neat and professional. It should include a title, author’s name, and supervisor(s).

The poster should display clearly in both A1 (594mm x 841mm) and A3 (297mm x 420mm) sizes. It is recommended that the poster be created as A1, so that it can be scaled to smaller sizes without loss of resolution. In this case you should check that it is clearly visible and readable when viewed at a smaller size. Alternatively you may design the poster using a smaller size layout, however you should ensure it has sufficient resolution to scale up to A1. It is recommended, for example, that you use vector graphics rather than bitmap graphics where possible, and suitable resolution images.

The poster must be submitted as a PDF file, by the deadline specified in the Unit Outline, to: LMS

Any software that produces PDF may be used. You should ensure your PDF is viewable in (at least) Adobe Reader.
